

One afternoon I made an Erc20 token after drinking a 100mg THC huckleberry lemonade and learning how simple the tokens really were. I couldn't afford an ETH token but Syscoin has crazy low transaction fees so I somehow came out with 1 duplicate coins.

I decided to send all 1 million of Uttkoin2 to the contract address and make a go of it. One professional website later and we are on the path to great things.

Here's the code:

```
// SPDX-License-Identifier: GPL-3.0
```

```
pragma solidity ^0.8.0;
```

```
import "@openzeppelin/contracts/token/ERC20/ERC20.sol";
```

```
contract DevToken is ERC20{  
    constructor() ERC20("Uttkoin", "UTTKE"){  
        _mint(0x2AEADC6D7f7aaC503a5C314593b3aff953b7eE89,1000000*10**18);  
    }  
}
```
